Safety instructions

At least two people are required to install the roofing. Three people for the glass covering.

Wear suitable protective gloves during assembly.

When using ladders and stairs, ensure that they are on a firm surface to ensure a secure footing.

It is recommended to wear suitable safety shoes during assembly.

Wear suitable safety goggles and hearing protection when drilling and sawing.

Assembly requirements

The following requirements must be observed for correct installation!

Wall

Make sure that the wall on which the patio cover is to be mounted is made of stone or other hard stony materials.

The fixing materials supplied are only suitable for the wall types described here. In the event of deviations, suitable fasteners must be selected.

Ground

The ground in the area of the posts must be firm so that the patio cover does not sink in.

Tamped sand in combination with the concrete base is preferable. If necessary, a buried gravel tile, for example, can be used as a base for the concrete pedestal. In soft, sandy soils, a paving slab can increase the bearing surface of the concrete base and thus optimally distribute the load on the soft substrate.

The maximum floor load under extreme conditions is up to 5200 kg/m².

Snow

Place a terrace roof that meets the requirements of the snow zone in your region where the roof is to be installed. Depending on their size and design, our roofings are approved for areas with snow load zone 1 or snow load zone 2.

In areas with heavy snowfall, measures should be taken to ensure that the snow can be easily removed from the roof covering if necessary.

Maintenance and cleaning

The powder-coated aluminium makes your roofing very maintenance-free. Periodic cleaning with e.g. non-aggressive cleaning agents or methods is sufficient (the use of aggressive cleaning agents or methods will invalidate the guarantee). If necessary, the roof panels can be hosed down with a high-pressure cleaner.

Make sure that you never step directly on the roof covering when walking on the roof. Lay out a wide board to distribute the forces and prevent damage to the lacquer finish.

If paint damage occurs, it can be easily repaired with a touch-up pen in the corresponding RAL colour.

Assembly requirements

Check each component for damage before installation!

We attach great importance to careful packaging, transport and delivery of your terrace roofing. Despite all precautionary measures, it cannot be ruled out in individual cases that the goods may arrive without damage. If necessary, please photograph the damage and contact us immediately.

- In order to maintain both CE conformity and the warranty, the instructions in the installation manual must be strictly adhered to. Any deviation from this may invalidate the warranty and CE conformity.
- In order to maintain CE conformity, only a roofing that fulfils the requirements of the snow load zone in which it is to be installed may be installed.
- Ensure that the roofing is properly earthed if it is fitted with lighting. Use a self-tapping screw on the inside of the wall profile (A10001).
- If more than one gutter is used, a support must always be fitted under the „coupling“. Both gutters must be shortened symmetrically when adjusting the width.
- It is not possible to install a rainwater drainage system in the support under the connection of two gutters.
- Take into account the expansion of the materials if the roofing is mounted tightly between existing buildings. Maintain a minimum clearance of 5mm on both sides.
- Only use the fasteners supplied with the roofing. These materials have been selected for their strength and properties in combination with aluminium. This does not apply to fasteners for mounting the wall profile (A10001). Although suitable screws and dowels are included in the delivery, these must be adapted to the mounting surface if necessary and replaced with suitable fasteners. Make sure that the screws and plugs have ETA approval, otherwise this may affect CE conformity and the guarantee.

1

NOTICE!

Length C corresponds to the passage height of the patio cover and must not exceed 295cm.

The installation height to the lower edge of the wall mounting profile is calculated using the formula given.

- i** In the appendix you will find an overview table for determining the installation height based on the depth D of the roofing. Please note that an additional (optional) installation of sliding glass walls requires a passage height C of at least 200cm to a maximum of 260cm.

2

NOTICE!

The drill bit shown for metal may differ in diameter if the mounting surface requires other fasteners.

Always select a metal drill bit with a nominal diameter one millimetre larger than the nominal diameter of the dowel fixing for drilling the wall connection profile.

- i** Use of unsuitable fasteners may affect the CE conformity and void the warranty.

29

i If required

i

Lightning

The number of recessed LED spotlights can be selected according to personal preference. It is recommended that the lighting is only installed within the intermediate rafters.

With one spotlight per internal rafter, this should be positioned in the centre of the rafter length. If there are two spots per inner rafter, we recommend dividing them into thirds or positioning each spot 25% of the length of the rafter measured from the respective outer edge.

30

31

i Connection according to the LED lighting instructions

32

i Extension cable if required, optionally available

33

i Double-sided adhesive tape, if required

NOTICE!

The following steps refer to installation with a wall adjacent to one or both sides.

In these steps, the gutter (A10138) only needs to be sealed on the side adjacent to the wall.

i The following illustrations show the gutter cover and end cap in the classic design, as well as a covering made of polycarbonate twin-wall sheets. The procedure for the respective installation steps remains unaffected by this.

39

C90010	Concrete base without integrated drainage

NOTICE!

The number and design of the respective components may vary depending on the configuration and size of the roofing.

In addition, not every terrace roof is equipped with rafter and gutter reinforcement.
